

IMPACT OF HUMAN CAPITAL DEVELOPMENT ON FIRMS' PERFORMANCE

Solomon Iheonunekwu; Augustine Okereke Ogwudire and Rev. Fr. Gabriel O. Okoko, (Ph.D)

Abstract

This paper explored the current literatures on human capital and its impact on firm performance. The purpose of this study is to develop a model to show the relationship between human capital and firm performance. The conceptualization of human capitals is closely linked to some fundamentals of economics and firm performance. The literature reviewed showed that there are reasonably strong evidences to show that the infusion of human enhancement in organizations promotes innovativeness and greater firm performance. Firm performance was viewed from two different perspectives; financial performance and non-financial performance. Financial performance includes productivity, market share and profitability, whereas, non-financial performance includes customer satisfaction, innovation, workflow improvement and skills development. The study also clearly substantiated the fact that financial performance is positively impacted through the consideration of human capitals. The paper made recommendations and conclusion.

In current global market, companies are composed by competitors, regardless of industry. To develop a competitive advantage, it is important that firms truly leverage on the workforce as a competitive weapon. A strategy for improving workforce productivity to drive higher value for the firms has become an important focus. Firms seek to optimize their workforce through comprehensive human capital development programmes not only to achieve business goals but most important is for a long term survival and sustainability. To accomplish this undertaking, firms will need to invest resources to ensure that employees have the knowledge, skills, and competencies they need to work effectively in a rapidly changing and complex environment.

In response to the changes, most firms have embraced the notion of human capital as a good competitive advantage that will enhance higher performance. Human capital development becomes a part of an overall effort to achieve cost-effective firm performance. Hence, firms need to understand human capital that would enhance employee satisfaction and improve performance. Although there is a broad assumption that human capital has positive effects on firms' performance, the notion of performance for human capital remains largely untested. Hence, this paper attempts to look into the connection between human capital and firms' performance. While much of the argument in the literature is in terms of factors contributing to performance, this paper looks at one of the factors i.e. human capital. Firm performance is a common issue in many organizations especially in this new era of globalization, where competitiveness and innovativeness are norms that go with performance.

This paper begins by defining the concepts of human capital and firm performance. It then explores the human capital theory and connection between human capital and firm performance. In the final section we develop the model and conclude the significance of the human capital as a pillar in future analysis of firm performance.

Human Capital and Firm Performance

What is human capital? According to Schultz (1993), the term "human capital" has been defined as a key element in improving a firm's assets and employees in order to increase productive as well as sustain competitive advantage. To sustain competitiveness in the organization human capital becomes an instrument used to increase productivity. Human capital refer to processes that relate to training, education and other professional initiatives in order to increase the levels of knowledge, skills, abilities, values, and social assets of an employee which will lead to the employee's satisfaction and performance, and eventually on a firm's performance. Rastogi (2000) stated that human capital is an important input for organizations especially for employees' continuous

improvement mainly on knowledge, skills, and abilities. Thus, the definition of human capital is referred to as “the knowledge, skills, competencies, and attributes embodied in individuals that facilitate the creation of personal, social and economic well-being” (Organization for Economic Co-operation and Development (OECD), 2001: 18).

The constantly changing business environment requires firms to strive for superior competitive advantages via dynamic business plans which incorporate creativity and innovativeness. This is essentially important for their long term sustainability. Undoubtedly, human resource input plays a significant role in enhancing firms’ competitiveness (Barney, 1995). Substantial studies have been carried out on human capital and their implications on firm performance (Agarwala, 2003; Selvarajan, Ramamoorthy, Flood, Guthrie, Macurtain & Liu, 2007). Lumpkin and Dess, (2005) in their study found that there is a significant relationship between innovativeness and firm performance under the human capital philosophy.

In relation to this, the definition of firms’ performance could vary from one and another. Nonetheless, some clear definitions of firms’ performance in the context of human capital enhancement could be put forward. In some cases, financial performance measures such as percentage of sales resulting from new products, profitability, capital employed and return on assets (ROA) (Selvarajan, Ramamoorthy, Flood, Guthrie, Macurtain & Liu, 2007; Hsu , Lin, Lawler, Wu 2007). Besides, return on investment (ROI), earnings per share (EPS) and net income after tax (NIAT) can also be used as measures of financial performance (Grossman, 2000). Interestingly, researchers also tend to benchmark managerial accounting indicators against the financial measures in six dimensions; ‘workers compensation’ (workers’ compensation expenses divided by sales); ‘quality’ (number of errors in production); ‘shrinkage’ (e.g. inventory loss, defects, sales return); ‘productivity’ (payroll expenses divided by output); operating expenses’ (total operating expenses divided by sales) (Wright, Gardner, Moynihan, Allen, 2005). On the other hand, firm performance can also be measured using ‘perceived performance approach’ (also referred to as subjective performance measure) where Likert-like scaling is used to measure firm performance from the top management perspectives (Selvarajan,et.al 2007).

Human Capital Theory

The theory of human capital is rooted from the field of macroeconomic development theory (Schultz, 1993). Becker (1993) argued that there are different kinds of capitals they include: schooling, a computer training course, and expenditures on medical care. And in fact, lectures on the virtues of punctuality and honesty are capital too. In the true sense, they improve health, raise earnings, or add to a person’s appreciation of literature over a lifetime. Consequently, it is fully in keeping with the capital concept as traditionally defined to say that expenditures on education, training, and medical care, etc, are investment in capital. These are not simply costs but investment with valuable returns that can be calculated.

From the perspective of Classical Economic Theory, human capital considers labour as a commodity that can be traded in terms of purchase and sale. This classical theory very much focuses on the exploitation of labour by capital. However, unlike the meaning traditionally associated with the term labour, human capital refers to the knowledge, expertise, and skill one accumulates through education and training. Emphasizing the social and economic importance of human capital theory, Becker (1993) noted that the most valuable of all capital is investment in human being. Becker distinguishes firm-specific human capitals from general-purpose human capital. Examples of firm-specific human capital include expertise obtained through education and training in management information systems, accounting procedures, or other expertise specific to a particular firm. General-purpose human capital is knowledge gained through education and training in areas of value to a variety of firms such as generic skills in human resource development. Regardless of the application, Becker considers education and training to be the most important investment in human capital.

Impact of Human Capital Development on Firms' Performance

Figure I, presents the key relations in human capital theory and the assumptions underlying these relationships.

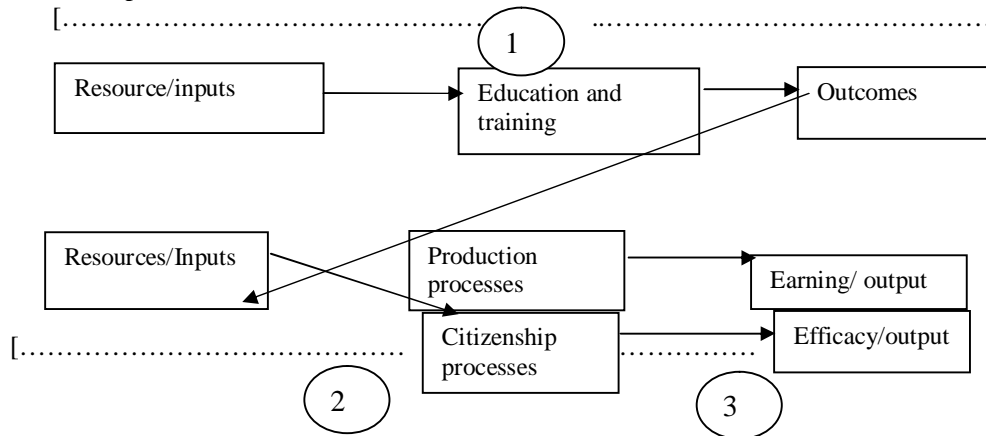

Figure 1: A Model of Human Capital Theory (Swanson & Holton2001:110)

Relationship 1 represents the concept of production functions as applied to education and training. The key assumption underlying this relationship is that investment in education and training results in increased learning.

Relationship 2 represents the human capital relationship between learning and increased productivity. The key assumption underlying this relation is that increased learning does, in fact, result in increased productivity.

Relationship 3 represents the human capital relationship between increased productivity and increased wages and business earnings. The key assumption underlying this relationship is that greater productivity does, in fact, result in higher wages for individuals and earnings for businesses. As per conclusion, human capital does contribute to the organizational advantages and profits. The entire human capital continuum represented is assessed using return-on-investment analysis or cost-benefit analysis. The human capital theory is an important agent for boosting firm performance. Thus, this study has capitalized on this theory for arguing that human capital becomes an element in firm performance.

The Relationship between Human Capital and Firm Performance

The human capital focuses two main components which is individuals and organizations. This concept had further been described by Garavan , Morley, Gunnigle, and Collins (2001) that human capitals have four key attributes as follows: (1) flexibility and adaptability (2) enhancement of individual competencies (3) the development of organizational competencies and (4) individual employability. It shows that these attributes in turn generate added values to individual and organizational outcomes. There are also various findings that incorporate human capital with higher performance and sustainable competitive advantage (Nordhaug, 1998); higher organizational commitment (Iles, Mabey,& Robertson, 1990); and enhanced organizational retention (Robertson, Iles, Gratton, & Sharply 1991). Hence, all these debates fundamentally focus on individual and organizational performance.

From the individual level, Collis and Montgomery (1995) pointed out that the importance of human capital depends on the degree to which it contributes to the creation of a competitive advantage. From an economic point of view, transaction-costs indicate that firm gains a competitive advantage when they own firm-specific resources that cannot be copied by rivals. Thus, as the uniqueness of human capital increases the firm has incentives to invest resources into its management

and the aim to reduce risks and capitalize on productive potentials. Hence, individuals need to enhance their competency skills in order to be competitive in their organizations.

The human capital theory has undergone a rapid development. Within its development, greater attention has been paid to training related aspects. This is much related to the individual perspective. Human capital investment is any activity which improves the quality (productivity) of the worker. Therefore, training is an important component of human capital investment. This refers to the knowledge and training required and undergone by a person that increases his or her capabilities in performing activities of economic value.

Some literatures show the importance of training in human capital development Mincer, (1997) a greater human capital stock is associated with greater productivity and higher salaries, training is linked to the longevity of companies (Bates, 1990) and greater tendency to business and economic growth (Geotz & Hu, 1996). In addition, Doucouliagos (1997) has noted human capital as a source not only to motivate workers and boost up their commitment but also to create expenditure in R&D and eventually pave a way for the generation of new knowledge for the economy and society in general. Also, for small businesses it is a valuable asset, which is positively associated with business performance. Finally, investment in training is desirable from both personal and social perspective. It is also fitting to point out that the workforce's lack of training is related to low competitiveness (Green, 1993).

From the organizational level, human capital plays an important role in the strategic planning on how to create competitive advantages. The work of Snell, Lepak, and Youndt, (1999) stated that a firm's human capital has two dimensions which are value and uniqueness. Firm indicates that resources are valuable when they allow improving effectiveness, capitalizing on opportunities and threats. In the context of effective management, value focuses on increasing profits in comparison with the associated costs. In this sense, firm's human capital can add value if it contributes to lower costs and provide increased performance.

Another study by Selim, Ashour, and Bontis (2007) analysed the relationship between capital and organizational performance of software companies. They found that the human capital indicators had a positive association on organizational performances. These indicators such as training attended and team-work practices tend to result in superstar performers where more productivity could be translated to organizational performances. This was also supported by Dooley (2000) who found a significant positive correlation between the quality of developers and volume of market share. Based on the above arguments we can conclude that human capital indicators enhanced the firm's performance directly or indirectly.

A study by Bontis and Fitzenz (2002) found the consequences of human capital management and established a relationship between human capital management and economic and business outcomes. In this study, a total of 25 firms in the financial services companies were selected. The study measured human capital effectiveness with four metrics; factor, expense factor, income factor and HC ROI. The fundamental aspects of any organization are to generate more revenue and income per employee. Human capital has a direct effect on the intellectual capital assets that will yield higher financial results per employee. The development of human capital is positively influenced by the educational level of employees and their overall satisfaction. Therefore, development of human capital has a direct impact on ROI of firms.

A causal model using a set of cross-sectional data developed by Selvarajan et al, (2007) indicates that human capital enhancement paves a way for greater innovativeness and this in turn offers positive implications on firm performance. In the meantime, firm performance and human capital could also be viewed in the context of high performance work systems (Hsu, Lin, Lawyer, & Wu, 2007). It is argued that the formation and emphasis on the human capital enhancement will result in high performance.

Impact of Human Capital Development on Firms' Performance

Admittedly, human capital development and enhancement in organizations tend to create a significant contribution on organizational competencies and this in turn becomes a great boost for further enhancing innovativeness and the current literature to a large extent supports the fact that firm performance is positively impacted by the presence of human capital practices (Noe, Hollenbeck, Gerhart & Wright 2003; Youndt et al, 2004). Some even endorsed that human capital development is a prerequisite to good financial performance (Delaney & Huselid, 1996) and in addition, the importance of organizational human capital with regard to firm performance was further supported by Hsu, Lin, Lawyer, and Wu, (2007). In addition, evidence shows that the relevance of human capital to firm performance has also become prevalent among the technology-based new ventures, and it seems that the use of human capital tool (emphasizing quality of employees) per say in small technology-based new ventures tends to have a great impact on the firm's success (Shrader & Siegel, 2007).

In the meantime, human capital enhancement can also be viewed in the context of top management team (TMT). Heterogeneity, some times called diversity in TMT will lead to greater performance because the argument is that heterogeneity promotes various characteristics to be absorbed into the workforce team; this includes people of different age groups, functional backgrounds, education backgrounds, tenure and gender. These characteristics have a positive impact on firm performance as argued under the upper echelon theory (Hambrick & Mason, 1984). Studies reveal that heterogeneity cultivates greater knowledge, creativity and innovation among the team members (Watson, Kumar, & Michaelsen; 1993; Maimunnah & Lawrence, 2008). Heterogeneity is positively linked to better problem solving and offering creative solutions (Michel & Hambrick, 1992). Hence, diversity is positively related to performance. Even in the context of an organization, the implementation of certain management approaches or philosophies also deals with the infusion of human capital (e.g. quality circles, team of employee's experts) especially when faced with problems (Kanji, 1997). Again, in a very broad discussion, especially in the context of total quality management (TQM), firms can be assessed using financial and non-financial performance. The financial performance includes employee productivity, defect rates and market share and non-financial performance that include workflow improvement, innovation, customer satisfaction and skills development (Kaplan & Norton, 1994).

Besides this, diversity is able to attract and retain the best talent available; reduced costs due to lower turnover and fewer lawsuits, enhanced market understanding and marketing ability, better problem solving, greater organizational flexibility and better overall performance and improvement in decision making at strategic level (Bantel, 1993). Heterogeneity is positively linked to better problem solving and offering creating solutions (Michel & Hambrick, 1992). A recent study in the related area also provides some insightful information about the heterogeneity effect on firm performance (Maran, 2008).

Undoubtedly, heterogeneity (in the form of human capital) can be a significantly important input to human capital development and enhancement as it makes organizations to be more creative and innovative for long term survival in their international and global markets (Grossman, 2000). In the light of this, the competency of TMT is supported by the input-based international human capital, transformational human capital and output-based international human capital (Huang, Roy, Ahmed, Heng, & Lim 2002). However, some even argue that the relationship between innovative human resource practices (though human capital practices are not directly involved) and organizational performance could be described as 'non-linear' (Becker & Barry, 1996; Chadwick, 2007).

Conceptual Model

The purpose of this study is to develop a model to show the relationship between human capital and firm performance. As argued in the earlier discussions, the general human capital investment includes training, education, knowledge and skills that will enhance human capital effectiveness. Based on the literature reviews, it is therefore postulated that human capital leads to greater firm performance. Firm performance can be viewed in two different perspectives; financial performance and non-financial performance. Financial performance includes productivity, market

share and profitability, whereas, non-financial performance includes customer satisfaction, innovation, workflow improvement and skills development. The details are given in Figure 2.

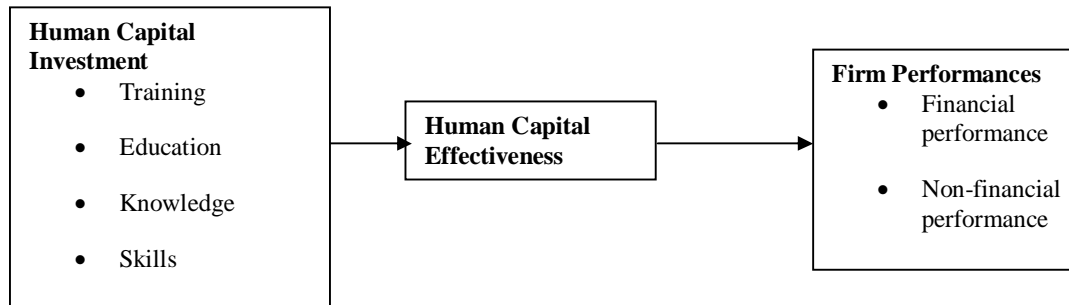

Figure 2: Conceptual Model linking Human Capital Investment, Human Capital Effectiveness and Firm Performance.

Conclusion

This paper explored the current literature on human capital and its impact on firm performance. The conceptualization of human capitals is closely linked to some fundamentals of economics and firm performance. The literature reviews show that there are reasonably strong evidences to show that the infusion of human enhancement in organizations promotes innovativeness and greater firm performance. Studies also clearly substantiate the fact that financial performance is positively impacted through the consideration of human capitals.

In light of this, the understanding of firm performance in relation to human capitals should not be regarded as a phenomenon that only adds ‘more zeros’ in a firm’s profits; it is rather transforming the entire workforce as the most ‘valuable assets’ in order for the organization to pave ways for greater achievements via innovativeness and creativity. Hence, companies should therefore, come up with some effective plans especially in investing the various aspects of human capital as not only does it direct firms to attain greater performance but also it ensures firms remain competitive for their long term survival.

Recommendations

Firms should invest resources to ensure that employees have the knowledge, skills, and competencies they need to work effectively in a rapidly changing and complex environment. It is argued that the formation and emphasis on the human capital enhancement will result in high work performance. Human capital investment is any activity which improves the quality (productivity) of the worker. Therefore, training is an important component of human capital investment. Knowledge and training are required in order to increase workers capabilities in performing activities of economic values. In keeping with the capital concept as traditionally defined, expenditures on education, training, and medical care, should be seen as investment in capital. These are not simply costs but investment with valuable returns that can be calculated.
